

## EFFECT OF CELL-RATE™ ON PIG FATTENING

The following two groups of pigs were compared:

CELL-RATE™ group: 54 animals fed a standard feed **plus** 500 ppm CELL-RATE™

Control group: 36 animals fed a standard feed

### Fattening performance of CELL-RATE™ in pigs

	<i>CELL-RATE™ group</i>	<i>Control group</i>
<b>Fattening period</b>	<b>164.20 days</b>	<b>167.50 days</b>
<b>Fattening weight</b>	<b>97.69 kgs</b>	<b>92.67 kgs</b>

Calculated over the whole fattening period the average weight increase of the CELL-RATE™ group is **8.95 % higher** than the control group.

The **feed conversion** of the CELL-RATE™ group was better than of the control group.

<b>F.C.R.</b>	<b>Control group:</b>	<b>3.10</b>
	<b>CELL-RATE™ group:</b>	<b>2.83</b>

Despite of the higher weight at the end of fattening period the meat of the pigs in the CELL-RATE™ group shows a **lower content** of fat than the control group.
