

## EFFECT OF CELL-RATE™ ON WEIGHT GAIN WITH CALVES

The following trial was conducted at a feedyard in Calgary, Canada. A group of 60 “Test” calves (versus 60 Controls) were fed two pre-mixes that contained Cell-rate™. The Control Group was fed the same pre-mixes only they did not receive Cell-rate™.

The first pre-mix was fed from day 21 to day 80 and then the other premix from day 81 to 140.

The first premix contained 2.5 grams of Cell-rate™ per calf per day. The second premix delivered 2.4 grams per calf per day.

At the end of the experiment (post 120 days of feeding) the test calves had an average weight of 636 lbs (289kgs) and the control group had an average weight of 535 lbs (243kgs). The calves on Cell-rate had an average weight gain of 101 lbs (46kgs) more than the control group which was fed an identical diet without the inclusion of Cell-rate™.
